

首先运行程序，程序提示输入密码，我们随便输入一组数据结果如下：

```
please input ns-ctf password: 1111111
try again!
please input ns-ctf password: _
```

可以看到程序给出错误提示，使用 OD 打开程序，查找->所有参考文本字符串，结果如下

```
ASCII "flag:{NSCTF_md5065ca>01??ab7e0f4>>a701c>cd17340}"
ASCII "please input ns-ctf password: "
ASCII "%s"
ASCII "nsF0cuS!x01"
ASCII "try again!",LF
ASCII "please input ns-ctf password: "
ASCII "%s"
ASCII "nsF0cuS!x01"
ASCII "flag:{NSCTF_md5065ca>01??ab7e0f4>>a701c>cd17340}"
```

转到“try again!”所在位置，

8B35 9420400	mov	esi, dword ptr [<&msvcr120.printf	msvcr120.printf
68 50214000	push	00402150	format = "please input i
FFD6	call	esi	printf
8B1D 9020400	mov	ebx, dword ptr [<&msvcr120.scanf	msvcr120.scanf_s
8D85 FCFEFFFF	lea	eax, dword ptr [ebp-104]	
50	push	eax	
68 70214000	push	00402170	ASCII "%s"
FFD3	call	ebx	<&msvcr120.scanf_s>
6A 0B	push	0B	maxlen = B (11.)
8D85 FCFEFFFF	lea	eax, dword ptr [ebp-104]	
BF 01000000	mov	edi, 1	
50	push	eax	s2
68 10214000	push	00402110	s1 = "nsF0cuS!x01"
FF15 9C20400	call	dword ptr [<&msvcr120.strncmp>]	strncmp
83C4 24	add	esp, 24	
85C0	test	eax, eax	
74 4B	je	short 0040112C	
68 74214000	push	00402174	ASCII "try again!",LF

这就很明显了，程序首先读取我们的输入，然后和内存中的字符串比较，相等则注册成功，不等则注册失败。而且可以很清楚的看到内存中的字符串为“nsF0cuS!x01”，即为所求。
